

Overview page

Each card, in simple words

Cards are listed in the order they appear. Energy on this page is finished 6:00 AM days only. Live "used so far today" is on Branch and Reports. Visitors always mean people who entered, not camera events. Cost is kWh x 0.20 SAR.

Needs attention

Only problems. If nothing is wrong, it says so. Click a card to open Branch.

Cooling

An AC is on and the room is 6 degrees or more hotter than the target.

Waste

Nobody is in the restaurant, but AC is still using power.

Data

We do not have a finished 6:00 AM energy day yet.

Power

Light circuits do not agree on voltage (40 V or more apart).

Table chips

Table / zone chips

Green = someone at that table or zone right now. Grey = empty. Entrance is hidden.

The 8 KPI cards

The Today / Month / Quarter / Year pills change Energy, Cost, Visitors, kWh per customer, and Saved. They do not change Visitors today so far, Dwell time, or Table use now.

Energy today / month / quarter / year

How much electricity we used in that range. Finished 6:00 AM days only, not live since this morning.

Energy cost

That same kWh x 0.20 SAR.

Visitors today / month / quarter / year

How many people entered. This one includes today.

Visitors today so far

Always today's entries, even if you pick Month. Compared with the same weekday last week. Peak = busiest hour so far.

kWh per customer

Energy divided by entries for the selected range. Lower is better.

Saved by the system

How much cheaper we are vs the same days last year, at 0.20 SAR/kWh. If we used more than last year, this is negative.

Average dwell time

Not connected yet. Always a dash.

Table use now

Share of tables that have someone sitting now, plus how many people are on the floor.

All branches

Only Al Malqa has real numbers. The other sites are listed as not integrated yet.

kWh / customer

This month's energy divided by this month's visitors.

Energy MTD

This month's finished-day kWh.

Saved MTD

SAR saved vs last year (same days), not vs last month. Shows zero if we used more.

vs Aug

Ignore the Aug label. It is percent vs last month. Down / green = we used less.

Trend

Last 14 days of energy.

Status

The first alert from Needs attention, or OK.

Energy saving (charts)

This month vs last month vs last year

Running total of kWh. Same day numbers compared (this month, last month, last year).

Where the change came from

That kWh split into Lights, AC, Oven, Freezer, Chiller.

12 month trend vs previous year

Last year of those loads, with a line for last year. Current month is month-to-date only.

Business insights (charts)

This month vs last month vs last year

Same idea as the energy chart, but for people who entered.

Customer visits by daypart

Typical mix: breakfast, lunch, afternoon, dinner, late night.

When customers come

Heatmap of weekday and hour. Darker = busier. Busiest and quietest times are written under the chart.

Closed days (bottom)

Lights / AC / Oven / Freezer / Chiller

Yesterday's finished kWh for that load, plus last 7 days.

Last 14 days

One stacked bar per day, by load. Today's bar stays empty until 6:00 AM tomorrow.

The one thing that trips people up

Overview energy is days we already closed at 6:00 AM. Live "used so far today" lives on Branch and Reports, not in these KPI totals.
